COMMITTED TO SUSTAINABILITY

Armstrong World Industries leads in delivering solutions that meet today’s most stringent industry sustainability standards. We are committed to environmental responsibility in all aspects of our business, and carbon reduction is part of our 2030 Company goals and ambitions.

We were one of the first companies to create and publish the Environmental Product Declaration (EPD) in the ceiling industry. We have over a decade of experience using Life Cycle Assessment (LCA) to evaluate environmental impacts of our products starting with design, to raw materials, and through our operations. We are constantly working to optimize our operations and products to reduce their environmental impact. We believe the use of LCA and our commitment to transparency of our products’ carbon footprint is critical to contributing to decarbonization of the built environment.

Contents:
- Performance features like acoustics, light reflectance, and durability
- Product application and use
- Product ingredients and their sources
- How the product is produced
- LCA results, including global warming potential and primary energy usage
- Total impacts over the product life cycle

Sphera

This life cycle assessment was independently verified in accordance with ISO 14044 and the reference PCR by:  
Thomas Gloria, Industrial Ecology Consultants

**LIMITATIONS**

Environmental declarations from different programs (ISO 14025) may not be comparable.  
Comparison of the environmental performance of Metal Ceiling and Wall System Products using EPD information shall be based on the product’s use and impacts at the building level, and therefore EPDs may not be used for comparability purposes when not considering the building energy use phase as instructed under this PCR.

Full conformance with this PCR allows EPD comparability only when all stages of a life cycle have been considered. However, variations and deviations are possible. Example of variations: Different LCA software and background LCI datasets may lead to differences in results for upstream or downstream of the life cycle stages declared.
2. GENERAL INFORMATION

2.1 DESCRIPTION OF ORGANIZATION
Armstrong World Industries, Inc. (AWI) is a leader in the design and manufacture of innovative commercial and residential ceiling, wall and suspension system solutions in the Americas. At home, at work, in healthcare facilities, classrooms, stores, or restaurants, Armstrong World Industries offers interior solutions that help to enhance comfort, save time, improve building efficiency and overall performance, and create beautiful spaces.

For more than 150 years, we have built our business on trust and integrity. It set us apart then, and it sets us apart now, along with our ability to collaborate with, and innovate for the people we’re here to serve – our customers, our shareholders, our communities, and our employees.

We are committed to developing new and sustainable ceiling solutions, with design and performance possibilities that make a positive difference in spaces where we live, work, learn, heal, and play.

2.2 PRODUCT DESCRIPTION
Medium textured Cortega® panels are an economical option with standard acoustical performance.

Features:
– Economical
– Non-directional visual reduces scrap and installation time

2.2.1 Product-Specific EPD
Cortega® Ceiling Panels are manufactured by Armstrong World Industries in Marietta, Pennsylvania (17547) and Macon, Georgia (31213). Armstrong World Industries has a robust internal Quality Assurance process that is based on industry-accepted best practices and is led by a team of quality professionals who have been certified by the American Society for Quality. The process involves several hundred different measures made throughout the manufacturing processes. In addition, our products are UL labeled for fire and acoustical performance – a process that involves strict oversight by Underwriters Laboratories. The Armstrong Ceilings acoustical laboratory is ISO 17025 certified and is accredited by the National Voluntary Laboratory Accreditation Program (NVLAP).
2.2.2 Product Identification
Cortega® panels offer a medium-textured, economical solution with standard acoustical absorption.

2.2.3 Product Specification
These products generally fall under ASTM E1264 Section 5.2 designation as Type III—Mineral base with painted finish.

The modifications typically involve modifications to the thickness, shape, density, basemat composition, and/or coating package.

This report covers the entire Cortega® product line and focuses on highest volume product in the family. Other products within the family that differ by shape, size, and edge details of the panels are well represented within the scope of the study.
2.2.4 Flow Diagram

Cortega® Mineral Fiber ceiling panels are manufactured using a wet-formed process. After arriving at the Armstrong manufacturing facility, the raw materials are processed and go through quality checks then mixed, water is added, and the mixture is formed into panels which are then dried. The panels are finished by application of back and prime coats, punching, lamination of scrim, final painting, cutting to size, and addition of edge detail. After packaging, the material is shipped and installed.

At the end of its useful life, the ceiling panel can then be recycled, sent to a landfill, or preferably recycled. Recycled ceilings can be returned to Armstrong World Industries as part of our closed loop recycling process as a raw material for new ceiling panels.

PRODUCTION STAGE

Raw Material Supply (A1) → Raw material extraction, processing, & packaging
Transport (A2) → Raw material transportation to factory by ship, rail, & truck
Manufacturing (A3) → Raw material storage, pre-processing, and mixing

CONSTRUCTION STAGE

Transportation to Site (A4) → Shipment to distributors and customers by truck or rail
Installation (A5) → Installation of the panels at the construction site by contractors

USE STAGE

Installation (B1-B7) → Use, maintenance, cleaning, & replacement by customer

END OF LIFE STAGE

Deconstruction & Transport (C1 – C2) → Removal of panels by demolition contractors. Transport to facility
Waste Processing & Disposal (C3 – C4) → Landfilling or sorting for recycling to manufacturing facility

RECYCLING STAGE

Reuse & Recycling (D) → Reuse of old ceiling panels into manufacturing of new panels
2.3 PRODUCT AVERAGE

2.3.2 Product-Specific EPD

In this specific case of Cortega® Mineral Fiber based product EPD, data collection for energy and other raw materials input stream was specific to the manufacturing location(s) and was supported by volume-driven mathematical modeling. For all the key raw materials, primary databases were used for LCA parameters. Other primary data were collected at the facility.

2.4 APPLICATION

The products covered by this EPD are designed to be installed in a suitable metal grid system typically designed to accommodate a nominal 24” x 24”, 24” x 48”, 24” x 60”, and made-to-order panels.

2.5 MATERIAL COMPOSITION

Major raw materials used in ceiling panel manufacturing are summarized in the table below.

<table>
<thead>
<tr>
<th>Material</th>

2.7 PROPERTIES OF DECLARED PRODUCT AS DELIVERED

The final EPD is available on the Armstrong website (armstrongceilings.com/epd); at UL SPOT (spot.ul.com) and is under the Finish category in the EC3 Tool (buildingtransparency.org).
3. METHODOLOGICAL FRAMEWORK

This study provides life cycle inventory and environmental impacts relevant to Armstrong® suspended ceilings. This LCA was conducted to 1) better understand the environmental impacts of the life cycle of suspended ceiling systems; 2) learn how the impacts of raw material selection, product formulation, and manufacturing process influence the life cycle impacts of suspended ceilings, and 3) use innovation to drive reduction in the product platform. The methods for conducting the life cycle assessments used for this project were consistent with ISO 14040 and 14044. This report is intended to fulfill the reporting requirements in Section 5 of ISO 14044 and Product Category Rules Guidance for Building-Related Products and Services UL® Environments (2021) Part B: Non-Metal Ceiling Panel EPD Requirements.

3.1 FUNCTIONAL UNIT

The declaration refers to the functional unit of 0.093 m² (1 ft²) of installed ceiling panel, as defined by the PCR.

3.2 DECLARED UNIT

The declaration refers to the declared unit of 0.093 m² (1 ft²) of installed ceiling panel, as defined by the PCR.

</table>

3.4 SYSTEM BOUNDARY

The scope of the study includes production, installation, use, end of life, and benefits and loads beyond the product system boundary. Production of capital equipment, facilities, and infrastructure required for manufacture are outside the scope of this assessment. Details of inclusions and exclusions from the system boundary are listed below.

THE CRADLE-TO-GRAVE ASSESSMENT INCLUDES:

- Raw material acquisition and processing for both the product and its packaging (A1)
- Inbound transport of raw materials to production facility (A2)
- Manufacturing energy of ceiling panels (A3)
- Energy production (A3)
- Manufacturing waste disposal (A3)
- Packaging of final products (A3)
- Outbound transport of products to job site (A4)
- Installation and installation waste (A5)
- Use stage considered, but no impact (B1-B7)
- End of life, including transport, deconstruction, waste processing, and disposal (C1-C4)
- Benefits and loads beyond the system boundary (D)
THE CRADLE-TO-GRAVE ASSESSMENT EXCLUDES:
– Overhead facility energy (heating, lighting, etc.) of manufacturing facilities (A3)
– Construction of capital equipment and other infrastructure flows
– Maintenance and operation of support equipment
– Human labor and employee transport
– Manufacture and transport of packaging materials not associated with final product

3.5 PRODUCT-SPECIFIC CALCULATIONS FOR USE PHASE (MODULES B1-B7)
Use (B1) of the ceiling panel does not require any activities that would contribute to potential environmental impacts of the product. Armstrong ceiling panels are manufactured using no added formaldehyde coatings. The VOC emissions during the use phase are negligible and the product complies with the Office and Classroom VOC Requirements of CDPH.

The ceiling panels do not require maintenance (B2), repair (B3), replacement (B4), or refurbishment (B5) as part of regular use. Typically panels are only replaced due to damage from leaking water or if the owner chooses to change them based on design requirements rather than performance concerns. The rate of replacement due to water leaks is minimal and there is currently no published data to help define this. It is believed to be minimal, with negligible effect on the overall potential environmental impacts of the ceiling panel. There is also no operation energy (B6) or water (B7) use for the installed ceiling panels.

3.6 PRODUCT-SPECIFIC CALCULATIONS FOR END-OF-LIFE PHASE (MODULES C1-C4)
At this time, there is no industry consensus for product-specific assumption behind reported scenarios for information in modules C1-C4. Armstrong facilitates ceiling panels recycling through our Takeback program. The recovery data is based on internal averages for commingled ceiling panels that arrived at Armstrong factories from the construction and demolition site at end of product life. Remaining panels were assumed to be landfilled as per standard industry practice.

3.7 REFERENCE SERVICE LIFE AND ESTIMATED BUILDING SERVICE LIFE
The Reference Service Life (RSL) was indicated according to Part A, Section No 2.8.2 in this document. The RSL was assumed to be 30 years for both ceiling and wall panel systems. Similarly the Estimated Building Life (ESL) was assumed to be 75 years for this study.

The assumptions upon which the designated RSL is based, and for which the RSL exclusively applies, shall be provided in Section 4.

3.8 ALLOCATION
No co-product or by-product allocation was necessary during manufacturing, use, or end of life. Allocation of background data (energy and materials) taken from the GaBi databases. In the case of secondary raw materials (i.e., recycled paper), only burdens from the point of recovery forward were considered (cut-off approach). The primary production of recycled materials was outside the system boundary.

3.9 CUT-OFF RULES
No cut-off rules are defined for this study. The system boundary was defined based on relevance to the goal of the study. For the processes within the system boundary, all available energy and material flow data have been included in the model. In cases where no matching life cycle inventories are available to represent a flow, proxy data have been applied based on conservative assumptions regarding environmental impacts.
3.10 DATA SOURCES
This study provides life cycle inventory and environmental impacts relevant to Armstrong® suspended ceilings. This LCA was conducted to 1) better understand the environmental impacts of the life cycle of suspended ceiling systems; 2) learn how the impacts of raw material selection, product formulation, and manufacturing process influence the life cycle impacts of suspended ceilings, and 3) use innovation to drive reduction in the product platform.

The methods for conducting the life cycle assessments used for this project were consistent with ISO 14040 and 14044. This report is intended to fulfill the reporting requirements in Section 5 of ISO 14044 and Product Category Rules Guidance for Building-Related Products and Services UL® Environments (2021) Part B: Non-Metal Ceiling Panel EPD Requirements.

Emissions associated with transportation were determined by capturing the average transportation distances and modes for inbound raw materials, distribution to installation, and end-of-life disposal. Energy use and the associated emissions were calculated using pre-configured transportation models from the GaBi database.

3.11 DATA QUALITY
Inventory data quality is judged by its precision (measured, calculated, or estimated), completeness (e.g., unreported emissions), consistency (degree of uniformity of the methodology applied on a study serving as a data source), and representativeness (geographical, temporal, and technological).

To cover these requirements and to ensure reliable results, first-hand industry data in combination with literature and background LCA information from the GaBi database were used. The LCI data sets from the GaBi database are widely distributed and used with the GaBi software. The datasets have been used in LCA models worldwide in industrial and scientific applications in internal as well as in many critically reviewed studies. In the process of providing these datasets they are cross-checked with other databases and values from industry and science.

3.12 PERIOD UNDER REVIEW
All the primary data in the scope of this analysis was collected from Armstrong manufacturing facilities during 2020.

3.13 COMPARABILITY AND BENCHMARKING
Cortega® ceiling panels offer a unique set of product attributes and we do not have any data on comparable non-competitive products to report.

3.14 ESTIMATES AND ASSUMPTIONS
There are no specific assumptions to list that are not dealt with in the appropriate section. When an assumption is made it will be described within the specific stage of the report. As an example a 7% waste factor was utilized for the waste generated during the installation of the product. This is described in more detail within the installation section of the report.

3.15 UNITS
Units commonly used in the North American market are included in addition to the required SI units.
4. TECHNICAL INFORMATION AND SCENARIOS

All data is reported as a North American weighted average across our ceiling plant locations. The majority of Armstrong® Ceiling products are distributed within 500 miles of the respective manufacturing plants. The same distribution trucks that take material to distribution centers backhaul post-consumer recycled ceiling panels to the manufacturing plants as part of our closed loop recycling program. If product is not recycled, disposal transportation at end of life is assumed to be 50 miles. Transportation emissions and fuels throughout the life cycle phases are included. All transportation associated with raw materials reflect the actual modes of transportation and mileage.

4.1 MANUFACTURING

The manufacturing process has been described in a simple flow chart in Section 2.2.4. When a product is manufactured at multiple locations, a volume-based averaging of the input parameters approach was used. Armstrong has a comprehensive environmental, health, and safety management program. Risk reduction begins in the product design process. All products go through a safety, health, and environmental review prior to sale. Armstrong also has a long standing commitment to the safety and health of all our employees. The company's safety management program is considered to be World Class. Our OSHA recordable incident rate is below 1.0, meaning that there is less than one injury per 100 employees per year. All employees view safety as a key responsibility of their jobs.

Armstrong World Industries is equally committed to reducing our environmental impact. As with safety goals, each manufacturing facility has environmental initiatives focused on responsible use of energy and water, and on waste reduction. Any manufacturing waste was reported in the primary data for this study.

4.2 PACKAGING

Armstrong® ceiling panels are well packaged in a variety of wooden panels, rigid corrugate, and stretch wrap. Stacks of material are banded to wooden pallets for shipping.
4.3 TRANSPORTATION

The following information specifies any transport after the manufacturing gate. Details of type of transport, type of vehicle, distance, type, and amount of energy carrier are listed. These values are consistent with industry standard assumptions.

4.4 PRODUCT INSTALLATION

The ceiling system must be installed in accordance with Armstrong Ceilings installation guidelines. Our ceiling system installation brochure, “Installing Suspended Ceilings”, is a general application overview, covering essential steps of a basic suspended ceiling installation. You can reference this document at armstrongceilings.com/installationinstructions

4.5 USE

As per the PCR it was assumed that no energy, material, and water inputs were needed during the use phase of the ceiling panel system under recommended normal operating conditions. Consideration of any resources used during maintenance and repairs during normal use of ceiling system were outside the scope of this study.
Maintenance (B2), Repair (B3), Replacement (B4), Refurbishment (B5)
Non-metal ceiling and wall panels were assumed to not need repainting, maintenance, or repairing, and to last the entire duration of the building ESL with no replacement or refurbishment.

Reference Service Life
A product’s RSL depends on the product properties and reference in-use conditions. The default RSL assumed in this PCR is 30 years for both ceiling and wall products.

4.6 DISPOSAL
End of Life
The end-of-life phase for the ceiling panels was included in the study. End-of-life impacts include disposal of ceiling panels, scrap, and packaging at the end of installation. Armstrong World Industries offers a ceiling recycling program as a closed loop end-of-life solution instead of landfill or alternative disposal methods. Although the ceiling recycling is a successful program, the volume does vary from year to year so a conservative approach was taken within the study to not include the recycle program but to rather consider that all panels are landfilled or incinerated. The study was also conservative in the fact that it did not take credit for any energy that was recovered in the landfill process.

5. ENVIRONMENTAL INDICATORS DERIVED FROM LCA

5.1 LCA RESULTS FROM LCIA

The Life Cycle Assessment (LCA) was performed according to ISO 14040 guidelines and follows the specific PCR instructions. The cradle-to-grave LCA consists of raw material production, transport of raw materials to production facility prior to processing, manufacturing of ceiling panels, packaging; transportation to job site and installation, use phase, and end of life including disposal or recycling to Armstrong factories.

5.2 LCA RESULTS FROM LCI

Life cycle impacts reported below are based on TRACI 2.1 methodology. All the results are provided in reference to the declared unit, and for convenience of the reader we have included additional grouping across the system boundaries and provided conversion in SI unit. For the other impact categories, results are presented in the tables below using the EN15804 standard and for the declared unit. Also for readers convenience conversions are provided in each table to SI units.

6. LCA: INTERPRETATION

From the 2020 LCA Model of the ceiling life cycle covered in this study, it was concluded that the ceiling panel manufacturing process and raw materials in the ceiling panel have the greatest impact on “carbon footprint” as represented by Global Warming Potential [GWP].

Life Cycle Impact Assessment of Cortega® Ceiling Panels\(^1\) relative importance in percentage terms for the Production, Use, and End-of-Life stages for the ceiling panel.

\(^1\) Based on U.S. EPA TRACI 2.1 Impact Factors
\(^2\) Data is from Cortega® 5/8" Square Lay-In items.
7. ADDITIONAL ENVIRONMENTAL INFORMATION

7.1 ENVIRONMENT AND HEALTH DURING MANUFACTURING

Armstrong World Industries has a comprehensive environmental, health, and safety management program. Risk reduction begins in the product design process. All products go through a safety, health, and environmental review prior to sale. Armstrong also has a long-standing commitment to the safety and health of all our employees.

Armstrong World Industries is equally committed to reducing our environmental impact. As with safety goals, each manufacturing facility has environmental initiatives focused on responsible use of energy and water, and on waste reduction.

7.2 ENVIRONMENT AND HEALTH DURING INSTALLATION

All recommendations shall be utilized as indicated by SDS and installation guidelines. Specific product SDS and installation instructions can be downloaded at: armstrongceilings.com/pdbupimages-clg/217521.pdf

7.3 EXTRAORDINARY EFFECTS

Fire Performance
Class A: ASTM E84 and CAN/ULC S102 surface burning characteristics. Flame Spread Index of 25 or less. Smoke Developed Index 50 or less. (UL® labeled)

Water/Sag Resistance
Standard performance ceiling panels are recommended where the building is enclosed and the HVAC is continuously functioning.

Insulation Value
ITEMS: 2195, 704, 816, 703 – R Factor – 1.6 (BTU units); R Factor – 0.28 (Watts units)
ITEMS: 770, 772, 769, 773, 823, 824 – R Factor – 1.5 (BTU units); R Factor – 0.26 (Watts units)
ITEMS: 747, 2765, 2758, 2767, 2776 – R Factor – 1.5 (BTU units); R Factor – 0.26 (Watts units)

Seismic Performance
Seismic Categories C, D, E, and F
ICC-ES ESR-1308 – see armstrongceilings.com/seismicrx

Acoustical Panel Classification
ASTM E1264 - Standard Classification for Acoustical Ceiling Products
Type III, Form 2, Pattern C, D, Fire Class A

Mechanical Destruction – Not applicable to ceiling products

7.4 DELAYED EMISSIONS

Our products contain a number of biobased ingredients such as starch, cellulose, or recycled newspaper, etc. The carbon stored in these products is effectively treated as equal, to avoiding fossil fuel emissions while calculating the carbon footprint. There is certainly a benefit to such carbon storage, potential delayed emissions in future extending to several decades are possible. Therefore, we included both total and fossil-fuel-based global warming potential in our results tables.
ENVIRONMENTAL PRODUCT DECLARATION

According to ISO 14025

7.5 ENVIRONMENTAL ACTIVITIES AND CERTIFICATIONS
All environmental certifications can be found at: Armstrongceilings.com

Additional Information can be found at: armstrongceilings.com Specific product SDS and installation instructions can be downloaded at: armstrongceilings.com/pdbupimages-clg/217521.pdf

8. PROJECT REPORT AND SUPPORTING DOCUMENTATION

This study provides life cycle inventory and environmental impacts relevant to Armstrong® suspended ceilings. This LCA was conducted to 1) better understand the environmental impacts of the life cycle of suspended ceiling systems; 2) learn how the impacts of raw material selection, product formulation, and manufacturing process influence the life cycle impacts of suspended ceilings, and 3) use innovation to drive reduction in the product platform. The methods for conducting the life cycle assessments used for this project were consistent with ISO 14040 and 14044. This report is intended to fulfill the reporting requirements in Section 5 of ISO 14044 and Product Category Rules Guidance for Building-Related Products and Services UL® Environments (2021) Part B: Non-Metal Ceiling Panel EPD Requirements.

Armstrong World Industries has a robust internal Quality Assurance process that is based on industry-accepted best practices and is led by a team of quality professionals who have been certified by the American Society for Quality. The process involves several hundred different measures made throughout the manufacturing processes. In addition, our products are UL® labeled for fire and acoustical performance – a process which involves strict oversight by Underwriters Laboratories. The Armstrong Ceilings acoustical laboratory is ISO 17025 certified and is accredited by the National Voluntary Laboratory Accreditation Program (NVLAP).
