Dune on Prelude XL Suspension System

Committed to Sustainability.

Armstrong is committed to delivering solutions that reduce the environmental impact of the buildings you create...from product design and raw material selection, to how our products are produced and delivered.

Now we provide Environmental Product Declarations (EPD's) to document the sustainability of our products. Inside this UL Environment certified ISO compliant EPD you will find:

- Performance features like acoustics, light reflectance, and durability
- Product application and use
- Product ingredients and their sources
- Information on how a ceiling system is produced
- Life Cycle Assessment (LCA) results including global warming potential and primary energy usage
- Total impacts over the life cycle of the product

Dune delivers a solid combination of performance attributes – clean aesthetics, and a reduced environmental footprint – making it a good product for commercial applications.

ENVIRONMENTAL PRODUCT DECLARATION

DUNE™ CEILING PANELS
MINERAL FIBER

According to ISO 14025

This declaration is an environmental product declaration (EPD) in accordance with ISO 14025. EPDs rely on Life Cycle Assessment (LCA) to provide information on a number of environmental impacts of products over their life cycle. Exclusions: EPDs do not indicate that any environmental or social performance benchmarks are met, and there may be impacts that they do not encompass. LCAs do not typically address the site-specific environmental impacts of raw material extraction, nor are they meant to assess human health toxicity. EPDs can complement but cannot replace tools and certifications that are designed to address these impacts and/or set performance thresholds – e.g. Type 1 certifications, health assessments and declarations, environmental impact assessments, etc. Accuracy of Results: EPDs regularly rely on estimations of impacts, and the level of accuracy in estimation of effect differs for any particular product line and reported impact. Comparability: EPDs are not comparative assertions and are either not comparable or have limited comparability when they cover different life cycle stages, are based on different product category rules or are missing relevant environmental impacts. EPDs from different programs may not be comparable.

2. Product System Documentation

2.1 Product Description

Armstrong® Dune Ceiling Panels are wet-formed mineral fiber acoustical ceiling panels, featuring a fine-textured, non-directional surface for increased durability. Dune ceiling panels are manufactured by Armstrong World Industries in Marietta, Pennsylvania (17547), Pensacola, Florida (32505), Macon, Georgia (31206), and St. Helens, Oregon (97051).

2.2 Application

Commercial Interior Finish. Acoustical, Suspended Ceiling System. The ceiling system must be installed in accordance with Armstrong installation guidelines. Our ceiling system installation brochure, "Installing Suspended Ceilings", is a general application overview, covering essential steps of a basic suspended ceiling installation. You can reference this document at armstrong.com/installationinstructions.

2.3 Technical Data

There are different levels of performance associated with mineral fiber ceiling panels. Performance information is included in this EPD to provide a total understanding of this product and its performance attributes.

Performance of Dune Ceiling Panels¹

Items Included in this EPD	Attributes
Dune Square Lay-in Panels for 15/16" Suspension System  1772, 1773, 1796, 1798	 NRC 0.50  CAC 35, Item 1772 CAC 30  Scratch-resistant  Recyclable
Dune Beveled Tegular Panels for 9/16" Suspension System  1775, 1777	 Fire Rating: Class A  Light Reflectance 0.83  Sag-resistant (HumiGuard® Plus) (excludes items 1796, 1798)
Dune Angled Tegular Panels for 15/16" Suspension System  1774, 1776	 Anti-Microbial (BioBlock® Coating)

2.4 Placing On the Market/Application Rules

The respective standard is listed in the table in Section 2.3 above for each attribute of the declared product.

EN ISO 14025:2006, Environmental labels and declarations – Type III – environmental declarations - Principles and procedures

EN 14040 ISO 14040:2006, Environmental management – Life cycle assessment – Principles and framework

EN 14044 ISO 14044:2006 Environmental management – Life cycle assessment – Requirements and guidelines

ASTM E1264-08e1 Standard Classification for Acoustic Ceiling Products

ASTM E84-12 Standard Test Method for Surface Burning Characteristics of Building Materials

ASTM C518-10 Standard Test Method for Steady-State Thermal Transmission Properties by Means of the Heat Flow Meter Apparatus

ASTM C636 / C636M-08 Standard Practice for Installation of Metal Ceiling Suspension Systems for Acoustical Tile and Lay-in Panels

ASTM C423-09a Standard Test Method for Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method

2010 Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers – Version 1.1 – California

ASTM E1414 / E1414M-11a Standard Test Method for Airborne Sound Attenuation Between Rooms Sharing a Common Ceiling Plenum

2.5 Delivery Status

Armstrong ceiling panels are well packaged in a variety of recyclable corrugated sleeves and box styles. Wooden pallets are used to protect unit loads during shipping.

2.6 Material Content

- **Back Coating** – A coating applied to the back of the product
- **Mineral Fiber Core** – Consists of fibers, perlite, recycled newspaper, and corn starch
- **Face Coating** – Durable, highly light-reflectant finish paint coating applied to the face
- **Hot Dipped Galvanized Steel** – Steel with zinc corrosion protection
- **Painted Finish** – Painted steel capping

2.7 Manufacture

Figure 3: Process for Manufacturing Dune Ceiling Panels

Dune mineral fiber ceiling panels are manufactured using a wet-formed process. After arriving at the Armstrong facility, the raw materials are mixed, water is added, and the mixture is formed into panels which are then dried. The panels are finished by application of back and prime coats, punching, final painting, cutting to size, and addition of edge detail. After packaging, the material is shipped and installed. At the end of its useful life, the ceiling panel can then be recycled, sent to a landfill, or incinerated. Recycled ceilings can be returned to Armstrong as part of our closed loop recycling process as a raw material for new ceiling panels.

2.8 Health, Safety, and Environmental Aspects During Manufacturing

Armstrong has a comprehensive environmental, health, and safety management program. Risk reduction begins in the product design process. All products go through a safety, health, and environmental review prior to sale. Armstrong also has a long standing commitment to the safety and health of all our employees. The company's safety management program is considered to be World Class. Our OSHA recordable incident rate is below 1.0, meaning that there is less than one injury per 100 employees per year. All employees view safety as a key responsibility of their jobs. In 2010, Armstrong was named one of "America's Safest Companies" by EHS Today.

Armstrong is equally committed to reducing our environmental impact. As with safety goals, each manufacturing facility has environmental initiatives focused on responsible use of energy and water, and on waste reduction.

2.9 Installation of Ceiling Systems

The ceiling system must be installed in accordance with Armstrong installation guidelines. Our ceiling system installation brochure, "Installing Suspended Ceilings," is a general application overview, covering essential steps of a basic suspended ceiling installation. You can reference this document at armstrong.com/installationinstructions.

Dune ceiling panels are HumiGuard® Plus – offering superior resistance to sagging in high humidity conditions up to, but not including, standing water and outdoor applications. (Excludes items 1796, 1798)

2. Product System Documentation (continued)

2.10 Packaging

Armstrong ceiling panels are well packaged in a variety of recyclable corrugated sleeves and box styles. Wooden pallets are used to protect unit loads during shipping.

2.11 Condition of Use

The ceiling system must be installed in accordance with Armstrong installation guidelines. Our ceiling system installation brochure, "Installing Suspended Ceilings," is a general application overview, covering essential steps of a basic suspended ceiling installation. You can reference this document at armstrongceilings.com/installationinstructions.

Dune ceiling panels are HumiGuard® Plus – offering superior resistance to sagging in high humidity conditions up to, but not including, standing water and outdoor applications. (Excludes items 1796, 1798)

2.12 Health, Safety, and Environmental Aspects During Installation

There are no recognized systemic hazards associated with installing ceiling panels. Armstrong recommends that installers handle materials in a manner to minimize airborne dust. Installers should wear appropriate personal protective equipment, such as gloves and safety glasses, to minimize exposure to dust and the potential for skin irritation.

2.13 Reference Service of Life

The system is warranted for 30 years of use; however, ceiling panels can last as long as the building's useful life if properly installed and maintained. The useful life indicated in the PCR for ceiling panels is 75 years. Warranty details can be found at www.armstrongceilings.com/warranty.

2.14 Extraordinary Effects

– Fire Performance

ASTM E84 and CAN/ULC S102 surface burning characteristics. Flame Spread Index 25 or less. Smoke Developed Index 50 or less. (UL labeled)

– Water/Sag Resistance

HumiGuard® Plus offers superior resistance to sagging in high humidity conditions up to, but not including, standing water and outdoor applications and carries a 30-year limited system warranty. (Excludes items 1796, 1798)

– Insulation Value

ASTM C518 Standard Test Method for Steady-State Thermal Transmission Properties by Means of the Flow Meter Apparatus

R Factor – 1.6 (BTU units)

R Factor – 0.28 (Watts units)

– Seismic Performance

2. Product System Documentation (continued)

2.15 Re-Use Phase

The preferred reuse method for a ceiling panel is to be recycled through the Armstrong Ceiling Recycling Program. Contact our Recycling Center at 1 877 276 7876 (press option 1, then 4), or visit www.armstrongceilings.com/ceilingrecycling. Armstrong started reclaiming and recycling ceiling panels in 1997. To date, Armstrong has recycled over 180 million square feet of used ceilings into new ceiling products.

2.16 Disposal

Disposal in municipal landfill or commercial incineration facilities is permissible and should be done in accordance with local, state, and federal regulations.

3. Life Cycle Assessment

This study provides life cycle inventory and environmental impacts relevant to Armstrong suspended ceiling systems. This LCA was conducted to 1) better understand the environmental impacts of the life cycle of suspended ceiling systems; 2) learn how the impacts of raw material selection, product formulation, and manufacturing process influence the life cycle impacts of suspended ceiling systems, and 3) use innovation to drive reduction in the product platform.

The methods for conducting the life cycle assessments used for this project were consistent with ISO 14040 and 14044. This report is intended to fulfill the reporting requirements in Section 5 of ISO 14044 and Part 2 of the Product Category Rules for Ceiling Panels for Suspended Ceiling Systems.

3.1 Declared and Functional Unit

The declared unit for this EPD is 1 M² of Dune ceiling panel for use over 75 years.

Armstrong has chosen to also report for 1 ft².

Dune	Value
Declared Unit	ft ²
DeclaredThickness (inches)	0.625
Surface Weight (lb/ft2)	0.82027128
Declared Unit	m ²
DeclaredThickness (cm)	1.588
Surface Weight (kg/m2)	4.013

3. Life Cycle Assessment (continued)

3.2 System Boundaries:

The system boundaries studied as part of this life cycle assessment include extraction of primary materials, raw materials manufacture, ceiling panel production, installation, and end of life.

The phases below outline a “cradle-to-grave” life cycle assessment for ceiling panels.

Ceiling Panels:

The Cradle-to-Grave Assessment Includes:

- Raw materials production including substrate, coating, and packaging materials for ceiling panels
- Transportation of raw materials to Armstrong manufacturing facility
- Manufacturing of the ceiling panels at an Armstrong manufacturing facility
- Packaging of finished products including energy to operate packaging equipment
- Transportation from manufacturing facility to distribution centers, retailers, and job site (assumed to be 500 miles by truck)
- Use phase covers a useful life of 75 years as suggested in the PCR and includes the transportation and installation of the system
- End of life includes landfill disposal of ceiling panels with assumed 50 miles truck transport from job site to landfill

The Cradle-to-Grave Assessment Excludes:

- Overhead energy usage (heating, lighting) of manufacturing facilities
- Maintenance and operation of support equipment

3.3 Assumptions:

There are no specific assumptions to list that are not dealt with in the appropriate section. When an assumption is made it will be described within the specific stage of the report. As an example a 7% waste factor was utilized for the waste generated during the installation of the product. This is described in more detail within the installation section of the report.

3.4 Cut-off Criteria:

- Mass – If a flow is less than 1% of the cumulative mass of the model, it is excluded, providing its environmental relevance is not a concern.
- Energy – If a flow is less than 1% of the cumulative energy of the model, it is excluded, providing its environmental relevance is not a concern.
- Environmental relevance – If a flow meets the above criteria for exclusion, yet is believed to potentially have a significant environmental impact, it is included.

ENVIRONMENTAL PRODUCT DECLARATION

DUNE™ CEILING PANELS
MINERAL FIBER

According to ISO 14025

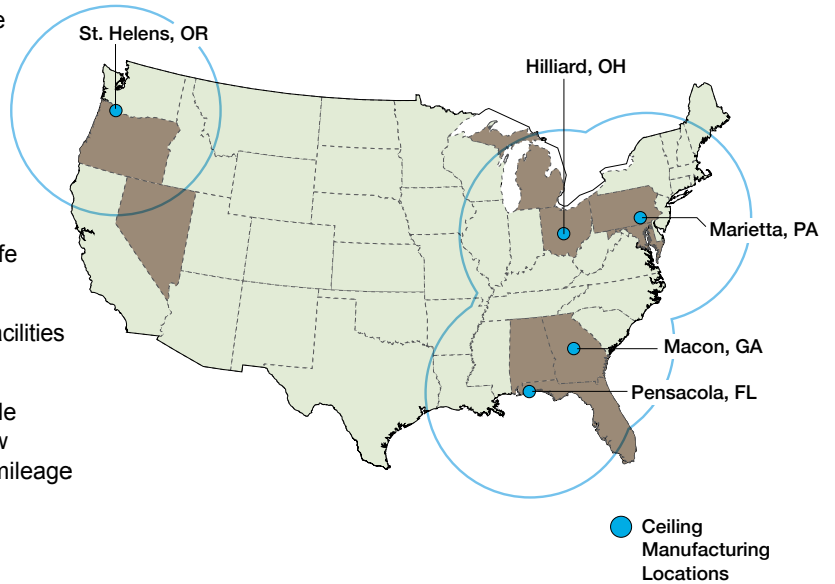

3. Life Cycle Assessment (continued)

3.5 Background Data:

All data is reported as a North American weighted average across our ceiling and suspension system plant locations. The majority of Armstrong ceiling products are distributed within 500 miles of the respective manufacturing plants. The same distribution trucks that take material to distribution centers backhaul post-consumer recycled ceiling panels to the manufacturing plants as part of our closed loop reclamation program. If product is not recycled, disposal transportation at end of life is assumed to be 50 miles.

This map shows the location of Armstrong manufacturing facilities with a circle denoting a 500-mile radius from each location.

Transportation emissions and fuels throughout the life cycle phases are included. All transportation associated with raw materials reflects the actual modes of transportation and mileage with the exception of recycled ceilings which assumes a transportation distance of 500 miles by truck.

3.6 Data Quality:

The LCA model was created using the GaBi Software system for life cycle engineering, developed by Think Step. The GaBi database provides the life cycle inventory data for several of the raw and process materials obtained from the background system. The data quality is considered to be good to high quality. With the exception of supplier specific data, all other relevant background data was taken from the GaBi database software.

All gate-to-gate, primary foreground data was collected for the ceiling panels manufacturing process. Background data was collected from suppliers or generic data was used. When generic data was used, it was verified and triangulated against several sources.

3.7 Period Under Review

Calendar year 2014 manufacturing data was used to create the LCA model.

ENVIRONMENTAL PRODUCT DECLARATION

DUNE™ CEILING PANELS
MINERAL FIBER

According to ISO 14025

3. Life Cycle Assessment (continued)

3.8 Allocation:

No allocation was performed within the modeling of Armstrong unit processes for Dune mineral fiber ceiling panels. Allocation occurred at the end of life phase for ceiling panels as they were partitioned based on 1% overall ceiling panel recycling rate. Credits for electricity and heat gained from thermal recycling of waste and packaging in a solid waste incinerator and/or landfill were not taken in this study.

4. LCA: Scenarios and Additional Technical Information

The following information is necessary for the declared modules and optional for non-declared modules. Modules for which no information is declared can be deleted; additional information can also be listed if necessary. Irrelevant or non-applicable module rows may be excluded in the EPD.

– Ceiling Panel Impacts

As shown in Table 6 on page 13, the majority of the environmental impacts for this product occur during the extraction and processing of raw materials detailed in the Production Stage. For most ceiling panels, the opportunity for reduction is in the manufacturing process as well as reductions associated with raw materials. Recycled ceiling panels used in the production process reduce raw material impacts by using less virgin raw materials.

– Use Stage:

Although Armstrong provides a 30-year ceiling system warranty, the use stage is defined in the PCR at 75 years and this is what was used in the LCA. The assumption is that the ceiling system requires no cleaning or maintenance so the impact is very small.

– End of Life Impacts:

End of Life impacts associated with landfilling and/or incineration of Dune ceiling panels range from 1% to 43% of all impact categories. For example, End of Life represented approximately 20% of the overall Global Warming Potential impacts for an Dune ceiling tile.

Transport To The Building Site (A4)

	Unit	Dune
Liters of fuel	l/100km	3412.556
Transport distance	km	805

4. LCA: Scenarios and Additional Technical Information (continued)

Installation Into The Building (A5)

Parameter	Unit	1 M ²	1 ft ²
Auxiliary	kg	0	0
Water Consumption	m ³	0	0
Other Resources	kg	0	0
Electricity Consumption	kWh	0	0
Other Energy Carriers	MJ	0	0
Material Loss	kg	0.2809	0.0260
Ceiling Panel Mounting System (CPMS)	kg	1.1230	0.1043
Ceiling Panel Mounting System (CPMS)	%	22%	22%
Output substances following waste treatment on site	kg	0.0000	0.0000
Dust in air	kg	negligible	negligible
VOC in Air	kg	negligible	negligible

Installation Into the Building

There is no energy or water use required for the ceiling system installation. For suspended ceiling systems, a 7% waste factor was assumed on site during construction. This value is based on historic internal studies which have documented the quantity of scrap that are generated at the job site due to needed cuts (to allow for the installation of sprinkler heads, for example) or mistakes. While this material can be and is recycled from some jobs, it is assumed that all of the on-site scrap material will be sent to a landfill located within 50 miles of the jobsite. The Prelude suspension was considered as part of the ceiling panel mounting system (CPMS).

The values in the table are based on a Prelude system used to install 2' x 2' square tiles at a typical depth of 4 feet from the deck. Hanger wires are every 4 feet and assumed that 6 foot long 12 gauge wire was utilized.

End of Life

End of life impacts include disposal of ceiling panels, scrap and packaging at the end of installation.

The end of life process within the LCA model assumed that 88% of the waste was landfilled and 12% of the waste was incinerated.

Armstrong offers our ceiling recycling program as a closed loop end of life solution instead of landfill or other alternative disposal methods.

The end of life phase for the ceiling tiles was included in the study. End of life impacts include disposal of ceiling panels, scrap, and packaging at the end of installation. Armstrong offers our ceiling recycling program as a closed loop end of life solution instead of landfill or alternative disposal methods. Although the ceiling recycling is a successful program, the volume does vary from year to year so a conservative approach was taken within the study to not include the recycle program but to rather consider that all tiles are landfilled or incinerated. The study was also conservative in the fact that it did not take credit for any energy that was recovered in the incineration of landfill process.

ENVIRONMENTAL PRODUCT DECLARATION

DUNE™ CEILING PANELS
MINERAL FIBER

4. LCA: Scenarios and Additional Technical Information (continued)

Reuse, Recovery And/Or Recycling Potentials (D), Relevant Scenario Information

Armstrong offers our ceiling recycling program as a closed loop end of life solution instead of landfill or alternative disposal methods. Although the ceiling recycling is a successful program, the volume does vary from year to year so a conservative approach was taken within the study to not include the recycle program but to rather consider that all tiles are landfilled or incinerated. The study was also conservative in the fact that it did not take credit for any energy that was recovered in the incineration of landfill process.

4.1 Additional Technical Information

In 2012, Armstrong created a third party verified LCA model to represent the environmental impact the grid would have on the entire ceiling system. Since that time there have been minimal changes to our manufacturing process and we maintain the same manufacturing locations. Although the Product Category Rules do not include suspension systems, we have included the 2012 grid LCA data and results below for informational purposes so our customers may have a better understanding of the environmental impacts of the entire ceiling system. The intent is to create a separate EPD for suspension systems in the future.

Material Content of Suspension Systems

4.1 Additional Technical Information (continued)

Process for Manufacturing Steel Suspension Systems

Armstrong suspension systems use hot dipped galvanized steel which is formed into coils. A large component of the steel is recycled material. The coils are split and painted, and then sent to Armstrong. At the Armstrong plant, the steel is pressed, roll formed, punched, and packaged. The material is then shipped and installed. When the system is disassembled, the majority of the steel is recycled.

Life Cycle Phases Included for the Steel Suspension System in Study:

ENVIRONMENTAL PRODUCT DECLARATION

DUNE™ CEILING PANELS
MINERAL FIBER

5. LCA: Results

The Life Cycle Assessment (LCA) was performed according to ISO 14040 and follows the PCR instructions. The cradle-to-grave LCA encompasses raw material production; transport of raw materials to production facility; manufacturing of ceiling panels; packaging; transportation to job site; use phase; and end of life including disposal or recycling.

MFR	Materials for recycling*	kg	0.0000	0.0000
MER	Materials for energy recovery	kg	0.0000	0.0000
EE	Exported energy	MJ, LHV	0.0000	0.0000

HWD = Hazardous waste disposed; NHWD = Non-hazardous waste disposed; RWD = Radioactive waste disposed; CRU = Components for re-use; MFR = Materials for recycling; MER = Materials for energy recovery; EE = Exported energy

ENVIRONMENTAL PRODUCT DECLARATION

DUNE™ CEILING PANELS
MINERAL FIBER

According to ISO 14025

6. LCA: Interpretation

From the results of the suspended ceiling system life cycle covered in this study, it was concluded that the ceiling panel manufacturing process and raw materials – specifically, mineral wool in the ceiling panel and steel in the suspension systems – have the greatest impact on Primary Energy Demand (PED) and “carbon footprint” (represented by Global Warming Potential [GWP]).

7. Supporting Documentation

Biopersistence of Mineral Wool Fibers

Slag wool fibers have been classified as “not classifiable as to its carcinogenicity to humans” (Group 3) by the International Agency for Research on Cancer (IARC) as referenced in volume 81. The MSDS for this product can be found at armstrongceilings.com/MSDS.

Quality Assurance

Armstrong has a robust internal Quality Assurance process that is based on industry-accepted best practices and is led by a team of quality professionals who have been certified by the American Society for Quality. The process involves several hundred different measures made throughout the manufacturing processes. In addition, our products are UL labeled for fire and acoustical performance, a process which involves strict oversight by Underwriters Laboratories. The Armstrong acoustical laboratory is ISO 17025 certified and is accredited by the National Voluntary Laboratory Accreditation Program (NVLAP).
