1. GENERAL

Chilled beams are an energy efficient way to cool spaces using piped chilled water. Price Chilled Beam fixtures, now compatible with TechZone ceiling systems, are narrower than standard chilled beams, and can be neatly integrated into our 12” wide technical panel.

The Price ACBL12 (1-way & 2-way discharge) active chilled beam series comes in 4’ and 8’ lengths. Lengths also range from 2’ to 12’ in 1’ increments.

Recommended list of install components needed (not provided by Armstrong Ceilings or Price Industries)

2. INSTALLATION CONSIDERATIONS

Chilled beams should be installed using flexible hoses.

When the mechanical contractor installs the chilled beam, it must be located within +/- 2” of the technical zone location. The unistrut must be mounted 14” above the finished ceiling height where it will be installed.

3. STEP ONE – MECHANICAL CONTRACTOR

Install unistrut to structure with appropriate support to carry the load of the chilled beam.

4. STEP TWO – MECHANICAL CONTRACTOR

Fasten the 6” threaded rod stud to the unistrut with a unistrut nut. Each unistrut will have two 6” threaded rod studs approximately 12” apart.

5. STEP THREE – MECHANICAL CONTRACTOR

Chilled beam should be installed 3” above the finished ceiling elevation to allow grid installation. Connections should be made using flexible hoses.

NOTE: If hard connections are used, the connections should be made in Step Six after the chilled beam is lowered into the ceiling grid and is in its final position.
6. STEP FOUR – CEILING CONTRACTOR

After the mechanical contractor installs the chilled beam, the ceiling contractor can install the grid.

7. STEP FIVE – MECHANICAL CONTRACTOR

Adjust the position of the chilled beam to align with the grid opening. Loosen the support connections. Take the weight of the chilled beam off the hangers. Shift the 6" stud or slide the bracket as needed. Retighten connectors. Once the grid is installed, adjust the hex nuts and lower the chilled beam into the grid.

Adjust the hex nuts to lower the chilled beam into the grid. Lower until the tegular edge of the diffuser just touches the grid flange.

8. STEP SIX – CEILING CONTRACTOR

Once the chilled beam is lowered into the grid, the ceiling panels can be installed.

NOTE: If hard connections are used, the connections should be made AFTER the chilled beam is lowered into the ceiling grid and is in its final position prior to installing the ceiling panels.

NOTE: The weight of the chilled beam must be supported by the hanger kit and NOT the ceiling grid.

NOTE: Lock nuts can be difficult to use with the required 3" adjustment. We recommend using a hex nut, washer, and lock washer with locking washer on the top and bottom of bracket. (see above photo)
